

IMAGINARY FRIENDS

Mental Health

IMAGINARY FRIENDS

It's estimated between 25 and 45% of three to seven year olds create imaginary playmates.

CHILDREN WITH AUTISM

About **1 in 59** children has been identified with autism. Autism is a complex neurobehavioral condition that includes impairments in **social interaction** and developmental language and **communication skills** combined with rigid, repetitive behaviors.

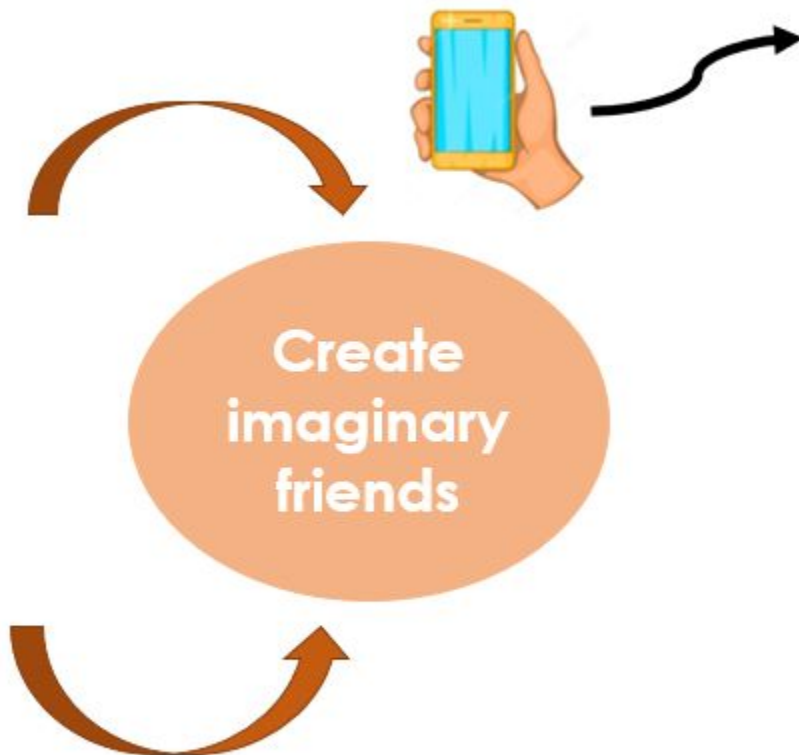

WHY IMAGINARY FRIENDS?

Playing with an imaginary friends or imaginary companion (IC) **helps children learn essential social skills** such as empathy with other people.

A project headed by a University of Huddersfield researcher confirms that children diagnosed with autism are able to create and play with **IMAGINARY FRIENDS**.
